

This form is not just a formality- it's a record of your decision to consent to a procedure having considered the risk of both positive and negative outcomes and medical risks listed below, and the impact they may have on your well-being.

What is being injected? Hyaluronidase is an enzyme that breaks down dermal fillers made of hyaluronic acid into small sugars which easily disperse.

Risks of injection: Trauma during the procedure is caused by needles and cannulas passing through tissue, and includes bleeding, bruising, hematoma (a larger collection of blood in the skin, outside of blood vessels), damage to underlying structures including veins, arteries, nerves, salivary glands, lymph nodes, bone, muscle and other soft tissue structures are possible. In rare cases this could cause continuous problems in appearance, sensation or function and may require medical intervention to treat or may be permanent. Most traumatic injuries heal completely on their own.

Reactions: Allergic reaction including anaphylactic shock are possible, they occur at a rate of between 1/2000 and 1/100 depending on the data source. Anaphylactic shock has a mortality rate 0.3 to 5% depending on the study. An allergy test can often identify this risk prior to full exposure. Local reactions include edema, erythema, pain and itching, urticaria and angioedema.

Side Effects: Hyaluronidase dissolves hyaluronic acid including molecules made by your body and previous treatments that you may wish to preserve could also be dissolved. You therefore could notice a reduction in skin elasticity and volume and associated asymmetry which typically would last a few days. It is common to cause bleeding, bruising, some swelling or edema and redness near the injection site.

Treatment Failure: It is possible that the procedure will fail to remedy the problem as often HA is not the sole cause of lumps, bumps or reactions. which may be caused by other materials.

Complications from infection: There is a small risk of introducing an infection, and a theoretical risk that pre-existing infection could spread further if hyaluronidase is injected into the area, risking septicemia though there are no recorded cases. I confirm I do not have any known allergies to hyaluronidase, and to your knowledge do not have any active cancers in the area injected and you are not pregnant or breastfeeding.

Follow-up: I understand adjustments requiring more product incur a charge.

Dissatisfaction: I understand that with all treatments the precise degree of improvement cannot be guaranteed. The outcome's subjective nature also means dissatisfaction is a possible outcome regardless of effectiveness of treatment. I understand that the effect of all treatments

may gradually wear off. Additional treatments may be necessary to acquire the desired effect, and further charges will apply if more product is required.

Agreement: By signing this form, you agree that you have read this form carefully and considered the side effects, risks and uncertainty of the outcome and decided the treatment is still in your best interests. You have discussed all the details of the treatment plan, past treatments and your medical history with your clinician and shared all the information your clinician may need to plan a treatment. You agree that the balance of the benefits and risks to you overall favor the use dermal filler. You understand that the initial treatment of side effects and complications is included in the cost of the procedure and therefore no refunds are issued due to any of the above occurring. You understand photographs are taken and stored as part of my clinical record.
